Contents

- Circle Equation:
  - Polar Form

  - Cartesian Form

- Circle Drawing Algorithms:
 - Bresenham's Circle Algorithm

Circle Equations

- Polar form

$$x = r\mathrm{Cos}\theta$$
$$y = r\mathrm{Sin}\theta$$

(r = radius of circle)

Drawing a Circle

```
θ = 0°
while (θ < 360°)
      x = rCosθ
      y = rSinθ
      setPixel(x,y)
      θ = θ + 1°
end while
```
Disadvantages

- To find a complete circle, θ varies from 0° to 360°
- The calculation of trigonometric functions is very slow.
Cartesian Form

- Use Pythagoras theorem

$$x^2 + y^2 = r^2$$

$$P = \left(x, \sqrt{r^2 - x^2} \right)$$

Drawing a Circle

- Step through *x*-axis to determine *y*-values

◆ <u>Disadvantages:</u>
– Not all pixel filled in
– Square root function is very slow

Circle

- Circle is an eight-way symmetric figure.
- The shape of circle is the same in all quadrants.
- In each quadrant, there are two octants.
- If the calculation of the point of one octant is done, then the other seven points can be calculated easily by using the concept of eight-way symmetry.

putpixel (x, y, color)
putpixel (x, -y, color)
putpixel (-x, y, color)
putpixel (-x, -y, color)
putpixel (y, x, color)
putpixel (y, -x, color)
putpixel (-y, x, color)
putpixel (-y, -x, color)

- If we want to display circle on screen then the putpixel() function is used for eight points as shown:

Continue…

- Let we determine a point (2, 7) of the circle then other points will be (2, -7), (-2, -7), (-2, 7), (7, 2), (-7, 2), (-7, -2), (7, -2).

- These seven points are calculated by using the property of reflection. The reflection is accomplished by reversing x, y co-ordinates.
Eight way symmetry of a Circle

Bresenham's Circle Algorithm

- Scan-Converting a circle using Bresenham's algorithm works as follows:

- Points are generated from 90° to 45°, moves will be made only in the +x & -y directions as shown in fig:

- We want to generate the points from 90° to 45°. Assume that the last scan-converted pixel is P_1. Each new point closest to the true circle can be found by taking either of two actions:

- Move in the x-direction one unit or

- Move in the x- direction one unit & move in the negative y-direction one unit.
Bresenham's Circle Algorithm

General Principle

- The circle function:

$$f_{circle}(x, y) = x^2 + y^2 - r^2$$

and

$$f_{circle}(x, y) = \begin{cases} < 0 & \text{if (x,y) is inside the circle boundary} \\ = 0 & \text{if (x,y) is on the circle boundary} \\ > 0 & \text{if (x,y) is outside the circle boundary} \end{cases}$$

Consider only
$45° \leq \theta \leq 90°$

Bresenham's Circle Algorithm

After point p_1, do we choose p_2 or p_3?

Bresenham's Circle Algorithm

Define: $D(s_i)$ = distance of p_3 from circle

            $D(t_i)$ = distance of p_2 from circle

i.e. $D(s_i) = (x_i + 1)^2 + y_i^2 - r^2$ [always +ve]

     $D(t_i) = (x_i + 1)^2 + (y_i - 1)^2 - r^2$ [always -ve]

- Decision Parameter $\boldsymbol{d_i = D(s_i) + D(t_i)}$

  so   if $d_i < 0$ then the circle is closer to p_3 (point above)

            if $d_i \geq 0$ then the circle is closer to p_2 (point below)

- From this equation, we can drive initial values of d_i.
- If it is assumed that the circle is centered at the origin, then at the first step x = 0 & y = r.
- Therefore,

        $d_i = (0+1)^2 + r^2 - r^2 + (0+1)^2 + (r-1)^2 - r^2$

        $= 1 + 1 + r^2 - 2r + 1 - r^2$

        $= 3 - 2r$

The Algorithm

$$\textit{if } d_i < 0 \textit{ then}$$

$$y_{i+1} = y_i$$
$$d_{i+1} = d_i + 4x_i + 6$$

$$\textit{else if } d_i \geq 0 \textit{ then}$$

$$y_{i+1} = y_i - 1$$
$$d_{i+1} = d_i + 4(x_i - y_i) + 10$$

$$x_{i+1} = x_i + 1$$

- Stop when $x_i \geq y_i$ and determine symmetry points in the other octants.

The Algorithm

- **Step1:** Start Algorithm

- **Step2:** Declare p, q, x, y, r, d variables
  p, q are coordinates of the center of the circle
  r is the radius of the circle

- **Step3:** Enter the value of r

- **Step4:** Calculate d = 3 - 2r

- **Step5:** Initialize   x=0
  &nbsy= r

- **Step6:** Check if the whole circle is scan converted
  If x > = y
  Stop

- **Step7:** Plot eight points by using concepts of eight-way symmetry. The center is at (p, q). Current active pixel is (x, y).
  putpixel (x+p, y+q)
  putpixel (y+p, x+q)
  putpixel (-y+p, x+q)
  putpixel (-x+p, y+q)
  putpixel (-x+p, -y+q)
  putpixel (-y+p, -x+q)
  putpixel (y+p, -x+q)
  putpixel (x+p, -y-q)

- **Step8:** Find location of next pixels to be scanned
  If: d < 0
  then d = d + 4x + 6
  increment x = x + 1
  Else If: d ≥ 0
  then d = d + 4 (x - y) + 10
  increment x = x + 1
  decrement y = y - 1

- **Step9:** Go to step 6

- **Step10:** Stop Algorithm
Example-1

$r = 10$

$d_0 = 3 - 2r = -17$

Initial point $(x_0, y_0) = (0, 10)$

i	d_i	(x_i, y_i)
0	-17	(0, 10)
1	-11	(1, 10)
2	-1	(2, 10)
3	13	(3, 10)
4	-5	(4, 9)
5	15	(5, 9)
6	9	(6, 8)
7		(7,7)

Example-2

Plot 6 points of circle using Bresenham Algorithm, when radius of the circle is 10 units. The circle has centre (50, 50).

Example-2

Plot 6 points of circle using Bresenham Algorithm, when radius of the circle is 10 units. The circle has centre (50, 50).

Solution: Let r = 10 (Given)

Step1: Take initial point (0, 10)

$$d = 3 - 2r$$
$$d = 3 - 2 * 10 = -17$$
$$d < 0$$
$$d = d + 4x + 6$$
$$= -17 + 4 (0) + 6$$
$$= -11$$

Step2: Plot (1, 10)

$$d = d + 4x + 6 \qquad (d < 0)$$
$$= -11 + 4 (1) + 6$$
$$= -1$$

Step3: Plot (2, 10)

$$d = d + 4x + 6 \qquad (d < 0)$$
$$= -1 + 4 \times 2 + 6$$
$$= 13$$

Step4: Plot (3, 9)

$$d > 0$$
$$x = x + 1, y = y - 1$$
$$d = d + 4 (x-y) + 10 \qquad (d > 0)$$
$$= 13 + 4 (3-9) + 10$$
$$= 13 + 4 (-6) + 10$$
$$= 23-24=-1$$

Step5: Plot (4, 9)

$$d = -1 + 4x + 6 \qquad (d < 0)$$
$$= -1 + 4 (4) + 6$$
$$= 21$$

Step6: Plot (5, 8)

$$d = d + 4 (x-y) + 10 \qquad (d > 0)$$
$$= 21 + 4 (5-8) + 10$$
$$= 21-12 + 10 = 19$$

Answer:

P_1 (0,0)$\Longrightarrow$(50,50)

P_2 (1,10)$\Longrightarrow$(51,60)

P_3 (2,10)$\Longrightarrow$(52,60)

P_4 (3,9)$\Longrightarrow$(53,59)

P_5 (4,9)$\Longrightarrow$(54,59)

P_6 (5,8)$\Longrightarrow$(55,58)
